

# Krishna Subedi

Full-Stack Engineer — Backend Systems & Web Platforms

[krishnasubedi219@gmail.com](mailto:krishnasubedi219@gmail.com) · [subedi-krishna.github.io](https://subedi-krishna.github.io) · [github.com/Luke23-45](https://github.com/Luke23-45)

## EXPERIENCE

### Neryva

Jul 2025 – Present

Member of Technical Staff · Remote

- Built multi-tenant backend services for the AI agent platform — row-level security and cryptographic isolation preventing cross-tenant leakage in RAG pipelines, REST APIs and messaging webhooks (WhatsApp/Slack/Telegram), asynchronous event backbone (brokers, task queues so agent loops never block HTTP), and real-time streaming over SSE/WebSockets; production deployment.
- Designed a node-based, drag-and-drop agent canvas where users can assemble customized agents from memory, instruction, and dashboard components, alongside guardrails and automated evaluation pipelines for production agent behavior across backend, frontend, and deployment. Demo: [neryva.com](https://neryva.com).

### Smaitic Labs

Apr 2024 – Jul 2025

Full-stack Developer

- Built a three-tier admin hierarchy (main/state/seller) with role-specific access and per-tier dashboards, with a multi-tenant Spring Boot backend (hierarchical RBAC, ZipCode-based delivery logistics) that accommodates new regions and sellers without structural change and runs an automated commission engine that eliminates manual per-order fee calculation.
- Shipped [Vanidya](#) marketplace applications across native Android (Kotlin) and an offline-first PWA, featuring real-time order tracking.

### Nepal Oil Corporation Limited

Oct 2023 – Mar 2024

Software Engineer

- Designed a time-series forecasting system for regional fuel demand, modeling surges, strikes, and protests so inventory allocation tracked real consumption spikes, supply stayed smooth, and swings never reached the pump.
- Built an automated dispatch reporting system for fuel logistics, consolidating daily depot and tanker movements into live dashboards that replaced manual end-of-day report preparation.

## PROJECTS

### Krishi Vaidya: AI-Powered Crop Disease Diagnosis

Apr – Jul 2026

Personal Project · Full-Stack

- Built an end-to-end crop disease diagnosis platform: an Expo Router mobile app with on-device TFLite/OpenCV inference for offline, zero-latency diagnosis in low-connectivity fields, and an Express.js API.
- Fine-tuned Qwen2.5-VL-3B via LoRA and trained a YOLO-based disease detector for multi-stage crop diagnosis, integrated with a Gemma-powered advisory pipeline and shipped to production iOS/Android apps.

### Ecommerce Platform: Multi-Seller Marketplace

Apr – Jun 2025

Personal Project · Full-Stack

- Built a multi-seller marketplace backend with five-role RBAC (customer, individual seller, vendor staff, vendor admin, superadmin) and vendor-scoped permission checks, alongside a multi-step Stripe checkout supporting saved payment methods, shipping, tax, and discount rules.
- Architected and delivered a multi-seller storefront and role-based admin portal, designing a variant-aware product catalog and client-side session-to-account cart reconciliation.

## EDUCATION

### Bachelor of Engineering in Mechanical Engineering

2019 – 2023

Tribhuvan University · Licensed PE

## SKILLS

**Languages:** C/C++, Python, TypeScript, Java, Kotlin, SQL, JavaScript · **AI/ML:** Generative AI/LLMs, RAG Pipelines, LLM Evaluation, Time-Series Forecasting · **Web/Backend:** Spring Boot, Node.js (Express 5), FastAPI, Django, React 19, Redux · **Data/Cloud:** PostgreSQL, MySQL, MongoDB, Redis, Docker, Kubernetes, Jenkins, AWS · **Architecture/Practices:** Microservices, Multi-Tenancy, CI/CD, RBAC, REST APIs, Linux, Jest, PWA
